Considerations Before Starting HIV Treatment

Last updated: March 30, 2021

Together, we can change the course of the HIV epidemic...one woman at a time.

Considerations Before Starting HIV Treatment

• If you’re living with HIV, treatment with HIV drugs can improve your quality of life and help you stay healthier longer

• Starting treatment is a big decision
Preparing for HIV Treatment

• To get the most benefit from HIV drugs, they **must be used exactly the way they are prescribed**
• Taking your treatment correctly is as important as which drugs you and your health care provider choose
• Before getting started, be prepared!
  – The right health care provider
  – Enough **knowledge about HIV**
  – A positive attitude

www.thewellproject.org
The results of a study called the **START trial** have shown once and for all:

- **People living with HIV who start treatment early, while CD4 counts are still high, have a much lower risk of illness and death**
  - Including people living with HIV who feel well
- **Taking HIV drugs earlier reduced likelihood of developing AIDS-related and non-AIDS related illnesses**

[www.thewellproject.org](http://www.thewellproject.org)
Scientific experts and policy makers came together in July 2015

- Issued statement declaring all people living with HIV should have access to HIV treatment as soon as they’re diagnosed
Benefits of Starting Early

- A longer life
- Having a higher CD4 cell count and keeping it high
- Preventing further damage to the immune system
- Decreasing risk for HIV-related and non-HIV-related health problems
- Reducing risk of transmitting HIV to others (*Treatment as Prevention* or *TasP*)
- No risk of transmitting HIV to sexual partners if on treatment and undetectable viral load (*U=U*)
Risks of Starting Late

- A shorter life
- Severely weakened immune system
  - Can take longer to restore immune system to full strength
  - Delaying treatment can increase chances that people living with HIV will develop AIDS and other serious illnesses
- Greater chance of immune reconstitution syndrome
  - Can worsen infections when HIV drugs are started and CD4 count is low
- Passing HIV to others, including sexual partners and babies, if you become pregnant
HIV Treatment Guidelines

- Issued by a variety of global and national agencies
  - Written and reviewed regularly by HIV experts
- Guidelines on starting HIV treatment:
  - U.S. Department of Health and Human Services (DHHS): All people living with HIV should take HIV drugs, no matter their CD4 count
  - World Health Organization and others: Since September 2015 also recommend all people living with HIV should take HIV drugs, no matter their CD4 count
• You and your provider ought to decide together when to start treatment

• Are **you and your provider a team?** Ask yourself:
  – Can I be totally honest with them?
  – Are they available when I have questions?
  – Do they take my concerns seriously?

• **If so, great!**
The Right Health Care Provider

• Not feeling fully respected? Consider talking to your provider or finding another (if you are able to choose)
  – Even if you have no choice of providers, being informed about HIV can help you in discussions with any provider

• Wise to have a health care provider who is an HIV specialist (treats many people living with HIV)

• To find HIV specialists near you:
  – Ask for suggestions from friends and/or ASOs
  – American Academy of HIV Medicine (AAHIVM)
  – HIV Medical Association (HIVMA)
  – International Association of Physicians in AIDS Care (IAPAC)

Goals of HIV Treatment

- Get your viral load as low as possible for as long as possible
- Preserve, improve health of immune system by increasing the number of CD4 cells
- Improve quality of life and reduce illness
- Reduce risk of transmitting HIV to others
Adherence

Taking drugs on schedule, as prescribed

• To get best benefits from HIV therapy, good adherence is required

• HIV drugs need to be kept at a certain level in your body

• Skipping doses, not taking drugs on time, not following food requirements can cause drugs to be less effective or stop working
Resistance

When a drug can longer fight HIV effectively

- If viral load goes up while taking HIV drugs, you should have a resistance test
- If your HIV develops resistance, you will likely have to change some drugs in your regimen

The best way to avoid resistance is to take your HIV drugs exactly as directed!
A Positive Attitude

When you think about starting treatment, it’s important to have a good attitude. May help to believe that:

• Starting treatment is the right decision for you
• HIV drugs will help you fight the virus
• You can take your medications the right way
A Positive Attitude

• **Think about why you’re starting treatment**
  – To keep yourself in good health – for your own sake, and/or for the good of your family

• **You need not wait until your immune system is damaged before taking HIV drugs**

• **Newer HIV drugs are much easier on your body and have fewer side effects**
A Positive Attitude

When you think about starting treatment, it’s important not to go it alone

- Put together a support system that may include:
  - Your health care provider
  - Social workers
  - Case managers
  - Family and friends
  - Support group of other people living with HIV
  - Online communities such as The Well Project’s A Girl Like Me!
